

ABSTRACT OF THE DISCLOSURE

An imaging apparatus (10) generates authentication data of image data extracted from an image file generated by the self apparatus or the other apparatus using ID data extracted from that image file, and a hash value generated based on common data read out from a memory (110) and the image data in the image file. The apparatus compares the generated authentication data with that in the image file to authenticate if the image data in the image file has not been altered.
